

Network Analysis used in JASP (version 0.18.0.0; JASP Team, 2023) for replication

Reproducing the Network Analysis in JASP (Version 0.18.0.0)

The network analysis (NA) reported in this manuscript was conducted using **JASP version 0.18.0.0**, which internally leverages R's `bootnet` and `qgraph` packages. The following guide outlines exactly how to reproduce the analysis, including all relevant parameters and visualization settings.

What You'll Need

- **JASP version 0.18.0.0**
Download from: <https://jasp-stats.org/previous-versions/>
- **Dataset file:**
`Data_Availability_Network Model for Human Playfulness During War.sav`

Step-by-Step Instructions

1. Open JASP 0.18.0.0

2. Load the Dataset

- Go to “**Open**” → “**Computer**” → “**Browse**”
- Select the file:
`Data_Availability_Network Model for Human Playfulness During War.sav`

3. Navigate to the Network Module

- In the top menu, select “**Network**”
- From the dropdown, choose “**Classic Network**”

4. Select Variables

Under “**Variables**”, include the following 14 variables:

- `FRAME_Coping`
- `FRAME_Playfulness`
- `FRAME_Control`
- `FRAME_Trans`
- `OLIW_S_Other.D`
- `OLIW_S_Lighth`
- `OLIW_S_Intellect`
- `OLIW_S_Whimsical`
- `BRS_AVG`
- `PCL_5_Intrusion`
- `PCL_5_Avoidance`

PLAYFULNESS DURING WAR

- PCL_5_NC
- PCL_5_Arousal
- DES_B_AVG

5. Estimation Settings

- **Estimator:** EBICglasso
- **Enable all output:** Check all boxes under:
 - Network Plot
 - Centrality Plot
 - Centrality Table
 - Clustering Plot
 - Clustering Table
 - Weights Matrix

6. Analysis Options (EBICglasso)

- **Correlation method:** Auto
- **Centrality settings:** Normalized
- **Network:** Weights and Signed
- **Missing values:** Exclude pairwise
- **Tuning parameter:** 0.5

7. Graphical Options

- **Node palette:** ggplot2
- **Edge size:** 1
- **Maximum edge strength:** 0.50
- **Minimum edge strength:** 0
- **Layout:** Spring
 - **Spring repulsion:** 1
- **Centrality measures:** Check all:
 - Betweenness
 - Closeness
 - Strength
 - Expected influence

(These settings allow for consistent visual interpretation of edge saturation and node proximity across networks.)

Interpretation Notes

- Positive edges appear in blue, negative edges in red
- Thicker and more saturated lines indicate stronger partial correlations
- Node position reflects relational centrality — more connected nodes cluster closer together

Exporting Results

- Use “File” → “Export” to save plots, tables, or the full results window as HTML or image files.

PLAYFULNESS DURING WAR

Additional Notes

- All procedures follow the description in the Methods section of the manuscript.
- The analysis focuses on partial correlations between psychological constructs and uses LASSO regularization via EBICglasso to mitigate false positives.
- A complete R-based replication using `bootnet` and `qgraph` is available separately to support transparency and reproducibility across platforms.
